Contractual warranty
Period 18 months

## Description

On energisation, the output(s) R close(s). On de-energisation, timing period T starts and, at the end of this period, the output(s) R revert(s) to its/their initial state.

2 If the device has been stored, de-energised, for more than a month, it must be energised for about 15 seconds in order to activate it. Subsequently, it only takes 1 second to start the time delay.

|  |
| :--- |
| UNEXPECTED EQUIPMENT OPERATION |
| If the time is not complied with, the relay remains energised indefinitely. |
| Failure to follow these instructions can result in death, serious injury, or equipment damage. |

## A.C. Load Curve 1

Electrical durability of contacts on resistive loading millions of operating cycles

X Current broken in A
Y Millions of operating cycles

## A.C. Load Curve 2

Reduction factor $k$ for inductive loads (applies to values taken from durability curve 1).

$X \quad$ Power factor on breaking $(\cos \phi)$
Y Reduction factor $k$
Example: An LC1-F185 contactor supplied with $115 \mathrm{~V} / 50 \mathrm{~Hz}$ for a consumption of 55 VA or a current consumption equal to 0.1 A and cos $\phi=0.3$. For 0.1 A , curve 1 indicates a durability of approximately 1.5 million operating cycles. As the load is inductive, it is necessary to apply a reduction coefficient $k$ to this number of cycles as indicated by curve 2 . For $\cos \phi=0.3$ : $k=0.6$ The electrical durability therefore becomes:1.5 $10^{6}$ operating cycles $\times 0.6=900000$ operating cycles.
