

LON® Data Exchange Coupler (Peer to Peer)

78 kbps; digital and analog signals

The data exchange coupler transfers the input process image data to the output process image of the coupled partner. The data exchange coupler is a variant of the LON® fieldbus coupler.

Applications:

- **Peer to Peer**
one master and one slave
 - **Broadcast**
one master and several slaves

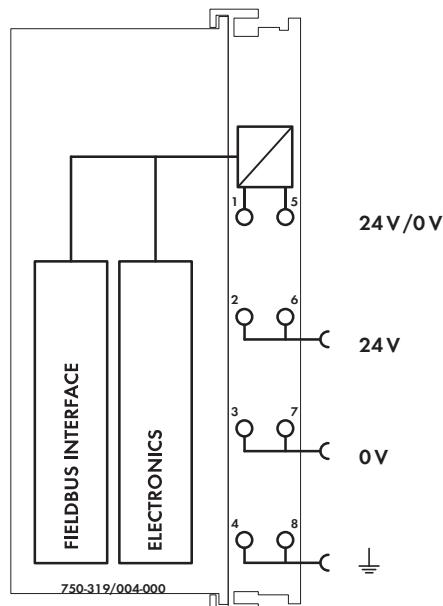

The coupler, together with I/O modules, is a fieldbus node which is connected to other nodes by means of a twisted wire pair. The coupler can also be integrated into existing LON® networks if appropriate node addresses are available.

The coupler automatically creates the process image using the types and widths of data of the connected I/O modules. The input process image is transferred to the output process image of the partner or partners.

The monitoring system switches digital outputs off or stores the last analog value if the connection to the coupled partner is interrupted longer than 1 second.

LON® is a registered trademark of Echelon Corporation.

4-Channel Digital Input Module 5 V DC

2-to 3-conductor connection; high-side switching

Delivered without miniature WSB markers

The digital input module receives control signals from digital field devices (sensors, etc.).

Each input module has a noise-rejection filter.

An optocoupler is used for electrical isolation between the bus and the field side.

Notice:

An additional supply module must be added for operation with 5VDC.
